

# ASCII Phonetic Symbols for the World's Languages: Worldbet

James L. Hieronymus

AT&T Bell Laboratories, Murray Hill, NJ 07974, USA

## *Abstract*

A new ASCII encoding of the International Phonetic Alphabet (IPA) and additional symbols has been designed for all languages. Many of the previous ASCII versions were targeted at European languages and therefore left out many of the sounds of the other languages or used symbols for unusual sounds like clicks, for plosive bursts. When an attempt was made to label a large number of languages with phonemic and phonetic symbols, these were found to be inadequate. The present scheme borrows on earlier work by George Allen, Ian Maddieson, John Wells, Laver et al. and Hieronymus et al. Wherever possible, the present scheme was made similar to the base IPA symbols, so that many of the symbols will seem to have obvious meanings. Many of the symbols are the same as other schemes. The underlying principle is that any spectrally and temporally distinct speech sound (not including pitch) which is phonemic in some language should have a separate base symbol. In most cases the base symbol consists of a concatenation of an IPA symbol and diacritics. Thus it is easy to recognize the phonemic base symbols and compare the same broad phonetic sound across languages. Tone languages have diacritics applied to the vowel phoneme symbols to properly identify the phonemes in these languages. Allophonic variations due to contextual coarticulation and stress may be labelled by a diacritic attached to the base symbol. It is possible that some speech sounds which are phonemic in at least one of the world's languages, are missing from the present version. It is hoped that any oversights will be corrected in subsequent versions of Worldbet, and a standard method for constructing new symbols is presented.

## **Introduction**

Many systems have been developed for writing the sounds of the world's languages. Many of the early workers made their own systems because there was no agreed standard or indeed knowledge of the complete speech sound inventory. The International Phonetic Alphabet was developed in 1888 and revised several times into its present form. It represents 105 years of experience with putting a symbol to each sound in all of the known languages in the world. The issues of economy of representation and the distinction between allophonic variation and true baseform sound have been worked out for many more languages since the IPA was originally formulated. Therefore it is a good place to begin for any multilanguage speech database labelling effort.

There are some sounds which are not normally included in the IPA which have been found to be useful in labelling large speech corpora like TIMIT, SCRIBE, BDSONS, and PHONDAT. These modern attempts at a standard ascii form of the IPA resulted in TIMITBET, MRPA, SAMPA, and SAMPA Extended to name a few of them. These phonetic alphabets were restricted to English or to European languages, and thus were too restricted in scope to be used in other major language families. The issue is whether or not the ascii representation is consistent, complete and logical for all of the IPA symbols.

Worldbet is an attempt to have a phonetic alphabet which covers all of the world's languages in a systematic fashion. It is an ascii version of the IPA plus a number of symbols which were found useful in database labelling, which are not currently in the official IPA set. This list of extra symbols may grow with time until all of the important phenomena have a coherent symbol representation.

This paper is organized to first cover the general principles of Worldbet, discuss earlier labeling sets, give specific symbol assignments, and discuss labeling methods. In Appendix A is an exhaustive list the Worldbet symbols and their corresponding labels in a few other systems, namely TIMITBET, SAMPA and JBET a phonetic alphabet used in speech synthesis. Appendix B is a table of place and manner of articulation v.s. Worldbet symbols. In Appendix C there are examples of Worldbet symbol inventories for several languages.

## **General Principles**

Worldbet is an ASCII version of International Phonetic Alphabet (IPA) with additional broad phonetic symbols not presently in the IPA. It is designed for a large set of languages including

Indian, Asian, African and European languages. Considerations of the special sounds in each of these languages lead to the principle that each base symbol will represent a speech sound with a spectrally distinct time sequence. Each type of /r/ will have its separate IPA like designation, rather than the more graphemic r used in some label sets. Allophones like aspirated plosives will have a separate base symbol from unaspirated plosives, if they are phonemic within the language in question, otherwise they will be marked using the base symbol plus diacritic). Distinct means to be so different spectrally or temporally as to be perceptually different, when the components are heard in isolation.

Vowels are classed into nominal place positions. It is recognized that the detailed vowel color may vary between languages for the same nominal vowel, yet separate symbols will be assigned only when the differences are large enough to constitute different phonemes. In actual labeling experience it has been found that most of the differences in phonetic labels between trained phoneticians were due to disagreements on the detailed vowel color, rather than the actual broad vowel color.

Therefore, Worldbet base symbols will represent phonemic distinctions in some language, as in the plosive example. The base symbols are thus meant to be broad phonetic, but can be used as surface phonemic symbols within a given language (as stated in the original principles of the IPA [1]). Since the IPA has been in use for over 100 years and has been actively developed and evolved over this period [2], it should have all of the phonemic distinctions observed in the world's languages to date. Therefore it is the natural starting point for any attempt to construct a phoneme set which is sufficient to cover all of the languages in the world.

Diacritics are used in general to modify the base symbols to deal with allophones which are due to coarticulation effects (i.e.: labialized /s/ in the environment of /w/), or phonological context effects. The diacritic allows the particular allophone to be marked, which has as its base character the phonemically based broad phone which is the origin of this allophone. Of course it is not always easy to determine what is an allophonic variation and what is a change of broad phonetic category. Normally the number of symbols to be used to label a particular language will be limited, to keep from having an overly large label inventory.

The motivating factor for Worldbet is to label speech for corpus driven speech research, phonological inventories, automatic language identification, multi-language speech recognition, and multi-language speech synthesis. It should also be useful in constructing multi-lingual dictionaries. In all of the above uses it is most convenient to have each sound labeled with a particular symbol closely resemble all other sounds with the same label, no matter in which language it is uttered.

### Previous Label Sets

Past work on ascii to ipa symbol sets was reviewed including the Klatt phonbet (Allen et al. [3]), the PHONASCII system (Allen [4]), Arpabet used in the first ARPA Speech Understanding Project [5], TIMITBET used in labelling the DARPA Acoustic Phonetic Database which was collected by Texas Instruments and labelled by MIT [6], the Esprit Speech Assessment Methodology Phonetic Alphabet (SAMPA [7]), the Edinburgh Machine Readable Phonetic Alphabet (MRPA [8]), the Alvey Project Phonetic alphabet [9], and the SCRIBE project phonetic label set (SAMPA Extended) [10]. These were generally concerned with one or a few Indo-European Languages, and thus are missing a number of the symbols needed for other languages. For SAMPA some simplifying assumptions were made because it was thought that they would be used for transcription within one language, not across languages. This leads to the same symbol being used for quite different sounds, most notably for /r/.

An effort for world wide ASCII to IPA coverage by Ian Maddieson [11] of UCLA was thought to be too complicated for the present application. It is a more detailed label set aimed at fine phonetic distinctions in all the world's languages. It does not distinguish between diacritics and baseforms. With the full set of diacritics in Worldbet it should be possible to have the same level of detail, with the proviso that phonemes with multiple places of articulation might have to have baseform symbols assembled using the Worldbet linking character . A new ascii version for the IPA which has been developed on the sci.lang email news group [12] has also been examined, but seems to suffer from too few languages being considered in detail. It is supposed to be used in email discussions of phonetics and phonology. It is a full encoding of the IPA and has some common symbols with

Worldbet.

PHONASCII, the ascii IPA symbol set by George Allen [4] is the closest to having the symbols required, but has added symbols for studying speech disorders and child language acquisition. Some of the constructions of affricates had the wrong fricative symbol and some of the monophthong vowels had two character symbols, which makes the construction of diphthongs awkward. Otherwise it is a complete encoding of the IPA set.

In Worldbet each IPA baseform symbol is represented by two ASCII normal characters which may differ in case (giving around 2,900 possibilities). Currently we are using 299 symbols. One of these characters may be a space. This fixed length baseform allows a unique specification, and ease in computer processing. It is envisioned that Worldbet will be used in computer speech synthesis and recognition, as well as hand labelling of speech in many languages. It becomes very important in this context that each symbol represent only one type of sound and that phonemes which have different forms across languages have a unique symbol for each form. Keeping a two character baseform will in practice prove to be unattainable for rare phonemes, for example all double articulations constructed with the linking symbol -. In Worldbet there are some symbols which go beyond the IPA set in an attempt to attain this goal, particularly for plosives.

## Specific Symbol Assignments

Generally the Worldbet symbol will be as close as possible to the corresponding IPA symbol. For the more unusual IPA symbols this is more difficult, and is sometimes only true in the most abstract sense. An effort has been made to consistently assign vowel and consonant symbols. The collection of phonemes from the UCLA Phonological Segment Inventory Database (UPSID) was examined to make sure that Worldbet covered all those used by 10 or more languages listed in Patterns of Sound by Maddieson [11].

Monophthong vowels will have base symbols which are usual vowel symbols orthographically (i.e. a, A, o, O) and numbers (2, 3, 4, 5, 6, 7, and 8). Most of these will be single printing symbols. This is so that the base diphthongs and free and checked vowels can be constructed of two characters. Since phonologically free and checked vowels are supposed to differ only in length, and not in spectral properties in the various languages (e.g.: /i/ in English is free and usually written [i:] phonetically. But it is a checked vowel in Dutch and written [i] phonetically.) the simple addition of the symbol : for long, allows this distinction to be represented easily in two characters. The numerals 0 and 1 are not used for base symbols because of their confusibility with the letters o and l.

Diphthongs are constructed by concatenating the two monophthong symbols which represent the endpoint vowels. While the present list contains many of the diphthongs seen in European languages, this list is not presently exhaustive. New diphthongs can be constructed by concatenating the two vowel symbols corresponding to the beginning and ending vowels of the diphthong.

Consonants can be two characters, since they do not always come in long and short versions. Many long consonants are actually geminates. It is recommended that geminates be transcribed as two consonants. Items like nasalization, rhotization and aspiration will be explicitly represented in the baseform, since they are phonemic in many languages. If it is found that consonant length is phonemic in some language, then ː will be added as a diacritic, as outlined below. See Table 1 for a comparison of IPA to Worldbet base symbols, and Table 2 for diacritics and suprasegmentals. Exhaustive symbol tables are shown in Appendix A. A phoneme set for 12 languages are shown in Appendix B. Presently Danish, Dutch, English, French, German, Hindi, Japanese, Mandarin Chinese, Russian, Castillian Spanish, and Tamil are listed.

CONSONANTS

The Worldbet representation of each IPA symbol is written below it. IPA symbols in parentheses are rare phonemes, for which no machine-readable coding has yet been proposed. (In these cases a coding employing diacritics is proposed.)

|                   | Bi-labial  | Labio-dental | Dental           | Alveolar   | Post-alveolar | Retro-flex     | Palatal       | Velar      | Uvular     | Pharyngeal | Glottal       |

| ◌̣ | Voiced         | v  | (,) Less rounded         |     | ◌̣ Palatalized                               | j | ◌̣ Nasal release           | n |
| ◌̤ | Aspirated      | h  | + Advanced               | +   | ◌̤ Velarized                                 | 2 | ◌̣ Lateral release         | l |
| ◌̥ | Breathy voiced | Hv | - Retracted              | -   | ◌̥ Pharyngealized                            | ! | ◌̣ No audible release      | c |
| ◌̥ | Creaky voiced  | ?  | ˘ Centralized            | x   | (~) Velarized or Pharyngealized (“emphatic”) |   |                            |   |
| ◌̥ | Linguolabial   | {  | ˘ Mid-centralized        | x   | ◌̥ Raised                                    | ^ | Velar place                | g |
| ◌̥ | Dental         | [  | ˘ Syllabic               | =   | ◌̥ Lowered                                   | / | Uvular place               | q |
| ◌̥ | Apical         | ]  | ˘ Non-syllabic           | (   | ◌̥ Unaspirated                               | * | (◌̥) Advanced Tongue Root  | ɿ |
| ◌̥ | Laminal        | }  | ˘ Rhoticity/retroflexion | r   | ◌̥ Glottalized                               | ? | (◌̥) Retracted Tongue Root | ɨ |

## SEGMENTAL TONE

|                       |    |                 |     |
|-----------------------|----|-----------------|-----|
|                       | ◌̥ | extra high tone | e_9 |
|                       | ◌̥ | high tone       | e_7 |
| Shown on the vowel e. | ◌̥ | mid tone        | e_5 |
|                       | ◌̥ | low tone        | e_3 |
|                       | ◌̥ | extra low tone  | e_1 |

## SUPRASEGMENTALS

Intonation and word-accent can be represented on a separate tier, using TOBI notation.

|    |                           |    |
|----|---------------------------|----|
| ◌̥ | Primary stress            | ◌̥ |
| ◌̥ | Secondary stress          | ◌̥ |
| ː  | Long                      | ː  |
| ◌̥ | Half-long                 | ː  |
|    | Short                     | ː  |
| ◌̥ | Extra-short               | (  |
| ◌̥ | Syllable break            | ː  |
|    | Pause (non-IPA)           | #  |
|    | Phrase boundary (non-IPA) | ## |

## OTHER SYMBOLS

|     |    |      |    |
|-----|----|------|----|
| ◌̥  | W  | ◌̥   | p  |
| w   | w  |      |    |
| (ɥ) | jw | !    | t  |
| (h) |    | ±    | c  |
| (ʔ) |    |      | l  |
| (ʔ) |    | l    | l) |
| ◌̥  | c} | (fj) |    |
| z   | z} | 3    | 3  |

## LINKING SYMBOL

|    |                |   |
|----|----------------|---|
| ◌̥ | linking symbol | - |
|----|----------------|---|

TABLE 2: Worldbet Diacritic and Suprasegmental Symbols

For special allophones there will be a diacritic linked to the main symbol by an underscore. Underscore will not be used for any other purpose. Base symbols with diacritics generally will be used for allophonic variations, rather than for phonetic symbols of regular speech segments in the languages of the world. For example, a labialized allophone of /s/ which is due to a nearby /w/ would be written [s\_w] and a rhoticized vowel /i/ will be i:r. The diacritic symbols are letters, math symbols, numbers or punctuation symbols. Numbers with the exception of 2 and 0 as diacritics are reserved for tone designations in tone languages.

Suprasegmentals are shown in the diacritic table for syllable boundaries, primary and secondary stress. Making for intonation and pitch accent is also provided. In tone languages, the tone is marked by odd number diacritics attached to the vowel on the broad phonetic level, since the tone is phonemic. Strictly speaking the tone is attached to the syllable rather than the vowel, but this allows a consistent label attachment point across all syllables.

### **Additional Broad Phonetic Symbols beyond IPA**

Several symbols were added to the IPA set which were found to be necessary to accurately label continuous speech databases which have been collected over the past 5 years. Some of these symbols have been used by phoneticians in the past, and some of the phenomena which they capture have been mentioned in the literature. The major departure is the inclusion of hyper aspiration for Indian languages and fricated plosives which were found in British English during the labeling of the SCRIBE database [10]. Hyper aspiration is meant to be a strong aspiration. This may be the property called breathy voiced aspiration in Hindi, but this is yet to be determined experimentally. It is used to denote strong aspiration, while h denotes ordinary aspiration. Another non-IPA symbol is the symbols for individual flaps t and d in order to allow the study of duration differences for the phonologically voiced or unvoiced flaps. In the tables which follow, the IPA column has square brackets around symbols which are not in the official IPA set, to mark them as pseudo IPA symbols.

### **Labeling Methods Using Worldbet**

Worldbet can be used for three labeling methods. The basic form of Worldbet is just an ACSII representation of the IPA. As such it can be used in exactly the same way that IPA is used to do labeling in which the phonetic and phonological or surface phonemic level are kept separate. The usual set of IPA diacritics are provided to mark variations.

The second method for using Worldbet is as a single level broad phonetic labeling which is based on the phoneme inventory of each language plus diacritics.[14] This allows the recovery of most of the information in the two level labeling scheme from one level of labeling, by stripping the diacritics from the broad phonetic labeling to collapse all allophones into the base symbol. Since it takes almost twice as long to label two levels as one, the single level scheme saves considerable time and effort. Not all of the allophones are within the class of the broad phonetic label, so that not all of the surface phonemes are produced by diacritic stripping. However some 97% of them are (based on experience with the British English SCRIBE database), and for practical applications this is enough to warrant using one level of labeling.

The phoneme is by definition language specific, denoting the minimal set of phonological elements which is sufficient to represent a specific language. Once the phoneme inventory for a language is determined, a set of baseforms are constructed by taking the base symbol from Worldbet and concatenating diacritic symbols without the underscore. For example in Hindi there are unaspirated and heavily aspirated stop consonants, therefore these would be represented as p t k b d g pH tH kH bH dH gH. In American English aspiration is not phonemic but occurs as the default in voiceless stop consonants so the labels would be ph th kh b d g. The broad phonetic inventory of labels which are phonemically based is thus constructed for each language.

Speech is labeled at a broad phonetic level using these phoneme based symbols with diacritics to denote broad phonetic variations. For example, an aspirated d in English would be labeled d\_h. When the labeling is finished, stripping the diacritics will then recover the surface phonemic labels for most cases. The cases in which this method fails is when the allophonic variant is in a different manner or place of articulation distant from the default phoneme. In Japanese, the phoneme /h/ has variants /f/ and /C/, which are sufficiently different from /h/ that they cannot be properly

constructed from the baseform /h/. For Japanese these allophonic variants occur in a very specific context and the phonemic level can be corrected with rules after the dialect stripping. With the difference between phonemic and allophonic variants labeled it is possible to determine if b<sub>h</sub> and bh are similar across languages or whether phonemic distinctions are more carefully produced and therefore aspiration in bh is more consistent in strength and length.

The third labeling method is called acoustic-phonetic segment labeling, which while using the phoneme based labels, attempts to label the actual regions of allophonic production. The part of a voiced fricative which is devoiced, z for example, with a separate diacritic, z<sub>0</sub> to show which section is voiced and which one is not. Similarly for labialized fricatives, the part during which the labialization is seen to have an effect is labeled s<sub>w</sub> and the non-labialized part is labeled s. This detailed differentiation of voicing and coarticulation effects allows studies of the overlap of phonetic features and the study of durations of these segments. Often phonologically voiceless plosives like t are completely voiced in intervocalic position. Normally a voiced consonant would be shorter than a long one. Does the speech production mechanism require that the voiced voiceless consonant be longer? This can only be answered by studying speech labeled with this level of detail captured in the labels. The acoustic-phonetic segment labeling should correspond to multi-level labeling used in non-linear phonology. For example the nasalization of a vowel would be labeled as to its onset time and so the tier in non-linear phonology corresponding to nasalization would include the nasal consonant and the nasalize portion of the vowel. This allows the study of the direction of feature spreading, and the limits on duration and overlap which form the parameters of the speech production process. Acoustic-phonetic labeling can be done on a single tier, and the broad phonetic labels obtained by diacritic clumping. All of the labels with the same adjacent label are examined, the diacritic with the longest duration can be applied to the whole segment and the other diacritics removed. Finally the phonemic level can be recovered by stripping off all of the diacritics, and retaining the baseform symbols.

## Phonological Inventories

Phonemes are, strictly speaking, defined only within a single language. The set of all observed phonemes from all the world's languages can be studied. Sets of these phonological elements across all languages are called phonological inventories. These have been collected by Greenberg and Ferguson at Stanford University and by Maddieson and Ladefoged at UCLA [11]. The aim of Worldbet is to include as a baseform all of the elements in the phonological inventory of all the languages of the world. These symbols are created by concatenating the Worldbet ascii IPA set and diacritics to make a phoneme set for each language. Because these symbols are constructed in a principled fashion, it is always easy to see what a Worldbet symbol represents within the IPA equivalent set from which it is constructed.

Speech from many languages labeled with Worldbet symbols will allow the study of the detailed characteristics of similar phonemes in different languages. Studies have been done in the past comparing the same phonological elements, for example nasals in French and English. The existence of multilanguage speech databases labeled with Worldbet will allow quantification of the difference between phonemes across a spectrum of languages. Even speech databases which are not labeled in Worldbet can have their phonetic label set mapped to Worldbet in order to simplify the process of cross language studies.
